Resumo	This study aimed to develop an algorithm for assessing the Dark Triad based on a measure for pathological personality traits, the Dimensional Clinical Personality Inventory 2. The sample comprised 968 participants. We found four specific factors: Machiavellianism, psychopathy, vulnerable narcissism, and grandiose narcissism, and a

general factor of dark traits. The IDCP-DT scale effectively distinguished people with different levels of dark personality traits. Sex differences were observed, with men and women demonstrating differences in the interpretation of some items. Overall, the IDCP-DT scale has the potential to identify people with different levels of dark personality traits in the general community.
