| Resumo                       | The objective of this study was to determine which Character Strengths can be predicted by Personality traits using the instruments Forças de Caráter (Character Strengths Scale) and Bateria Fatorial de Personalidade (Factor Personality Questionnaire). A total of 217 university students, with an average age of 22 years participated in this study; 53% were female. The results indicated that the strengths Vitality, Gratitude, Persistence, Spirituality, Kindness, Humor, Social Intelligence, Citizenship, Fairness, and Creativity were best explained by the traits Extraversion, Agreeableness, and Neuroticism. Moreover, Extraversion and Agreeableness were the traits that were most often associated with the Character Strengths. The findings were discussed in the light of relevant literature, and further studies were recommended. |
