Resumo	We developed and validated a self-report scale for screening pathological traits of dependent

---

personality disorder (DPD) from the Hierarchical Taxonomy of psychopathology (HiTOP) perspective. The sample was 693 adults who answered the new scale, the Dimensional Clinical Personality Inventory DPD (IDCP-DPD), the PID-5, the FFDI, and the FFBI. The IDCP-DPD was composed of six factors grouped in one general score. The scores showed associations with external measures in the expected direction, and the means comparisons showed large differences. Our findings indicated the IDCP-DPD as a useful clinical measure, and the structure observed confirms the spectrum level of the HiTOP
